Planning the framework

Some Strategies

Schedule as
Cron Job

Use our experience
setting up crontab

**SQL Query
Report**

**Use our existing
SQL reports**

**Export Results
to CSV**

**CSV is a standard
format to work with**

**Convert
CSV to XLS**

Find a converter

**Email XLS
to Library**

Find an email client

Implementation

- Can find online at http://evergreen-ils.org/dokuwiki/doku.php?id=scratchpad:automated_sql_reports

Future of the work

- Additional formatting
- Dealing with reports with zero results
- Adding new reports
- Implementing more refinements

No database access?

- Create scheduled reports
- Completion notification via e-mail
- Script pulls report data
- Import and process

**Don't do this unless
you have to**

Reports as Exports

- Create template that outputs raw data
- Schedule report
- Enable e-mail notification to special address

Act on the e-mail

- fetchmail -> procmail -> perl
- Report data is automatically downloaded
- Within a minute or so

act-on-mail.pl

```
#!/usr/bin/perl

# called by procmail, and receives the mail message on stdin

use strict; use warnings;

my $url;

while (<>) {
    if ($_ =~ /https:\\\\reporter/) {
        $url = $_;
        last;
    }
}

system("/home/stats/bin/fetch-report.pl", "-u", $url);
```

fetch-report.pl logic

- Fetch URL like:
[https://host/reporter/\[...\]/report-data.html](https://host/reporter/[...]/report-data.html)
- Automatically log in if needed (keep a cookie)
- Download report-data.csv and save to output dir

imports.ini example 1

[general]

dir=/home/stats/reports

state_dir=/home/stats/state

[group holdratio]

name=Hold Ratio

file1=holds_outstanding.csv

file2=holdable_copies.csv

file3=bib_info.csv

command=psql -f /home/stats/sql/holds_init.sql

#post-command=/home/stats/bin/mail-holdratio.pl

imports.ini example 2

[general]

dir=/home/stats/reports

state_dir=/home/stats/state

[group items_for_export]

name=Items for Export

file=items_for_export.csv

command=psql -f /home/stats/sql/items_for_export.sql

post-command=/home/stats/bin/export_bibs.pl -f /home/stats/output/bre_ids.csv

Import script overview

- Runs from cron
- Have all input files been updated since the last time I ran this import?
- Run import
- Update timestamp
- Run post-import command

The import process

- drop table
- create table
- import data
- process to output

The post-import

- Send the report output somewhere
- E-mail notify that “report’s ready at someurl”
- Trigger something like a bib export of the records that were output

One more thing...

- Don't forget to delete your scheduled report output

Custom reporting views exposed in the IDL

SQL views in the IDL

- Exposed via reporting interface
- Good for on-demand reporting
- Don't break the IDL
 - xmlint is your friend
 - pick a class id unlikely to collide

```
<class id="rlcd"  
  controller="open-ils.cstore open-ils.pcrud open-  
ils.reporter-store"  
  oils_obj:fieldmapper="reporter::last_copy_deleted"  
  oils_persist:readonly="true"  
  reporter:core="true"  
  reporter:label="Last Copy Delete Time" >
```

<oils_persist:source_definition>

```
SELECT b.id,  
       MAX(dcp.edit_date) AS last_delete_date
```

```
FROM  biblio.record_entry b  
      JOIN asset.call_number cn ON (cn.record = b.id)  
      JOIN asset.copy dcp ON (cn.id = dcp.call_number)
```

```
WHERE NOT b.deleted
```

```
GROUP BY b.id
```

```
HAVING SUM( CASE WHEN NOT dcp.deleted THEN 1  
              ELSE 0 END) = 0
```

</oils_persist:source_definition>

```
<!-- continued -->
  <fields oils_persist:primary="id"
oils_persist:sequence="biblio.record_entry">
  <field reporter:label="Record ID" name="id"
reporter:datatype="id"/>
  <field reporter:label="Delete Date/Time"
name="last_delete_date" reporter:datatype="timestamp"/>
  </fields>
  <links>
  <link field="id" reltype="has_a" key="id" map=""
class="bre"/>
  </links>
```

```
<!-- continued -->  
  <permacrud xmlns="http://open-ils.org/spec/opensrf/  
IDL/permacrud/v1">  
    <actions>  
      <retrieve/>  
    </actions>  
  </permacrud>  
</class>
```

The Future

- General third party reporting frameworks?
- Library Dashboards?
- Your Ideas?
